

NASAL TAPING

STEP 1

The “U” piece is applied with medium upward pressure to minimize tip drop.

The bottom piece is crimped.

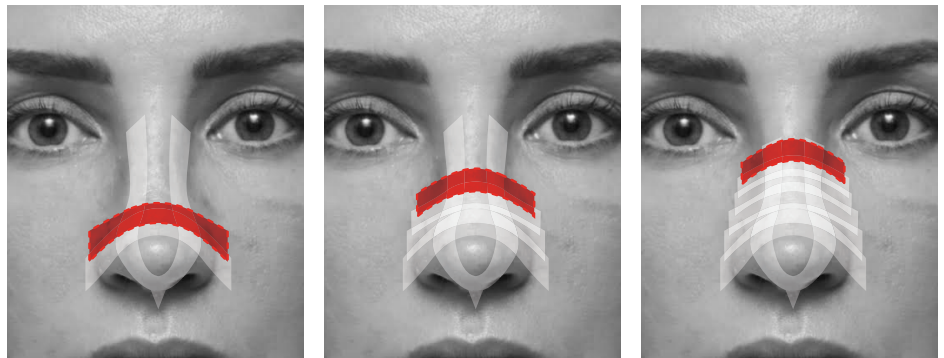

STEP 2

The “supratip” piece is applied ABOVE the tip with strong compressive force to minimize scar tissue formation.

STEP 3

With a 50% overlap, the remaining bridge is taped gently with 2-3 more pieces up to the eye level.

HOW TO REMOVE

- Soak the tape with makeup remover or Micellar water
- Wait 30-60 seconds
- Use one end of tweezers to slide under the tape and “separate” it
- Do **NOT** pull off the tape, it must be separated gently from the skin
